

The uncertainty short-list, root causes and probability trees

Contributor: Mark Bentley, TRACS Training

'Long list' of 8 uncertainties with 256 possible combinations (figure right) is reduced by considering:

- whether the model purpose is not sensitive to some uncertainties
- whether some are interdependent and should therefore be combined and
- whether some uncertainties are the root cause of the others: in this case simply work on the root cause.

The regrouped uncertainties, now reduced to three and sketched for clarity (figure below) can be diagrammatically laid out on a probability tree (figure bottom right)

The uncertainty 'long list' converted to a 'short list'

1

Sand dist. *amalgamated sheets non-amalg. Channels*

2

Faults *sealing open*

Contacts *common stacked*

Fluids *single API variable API*

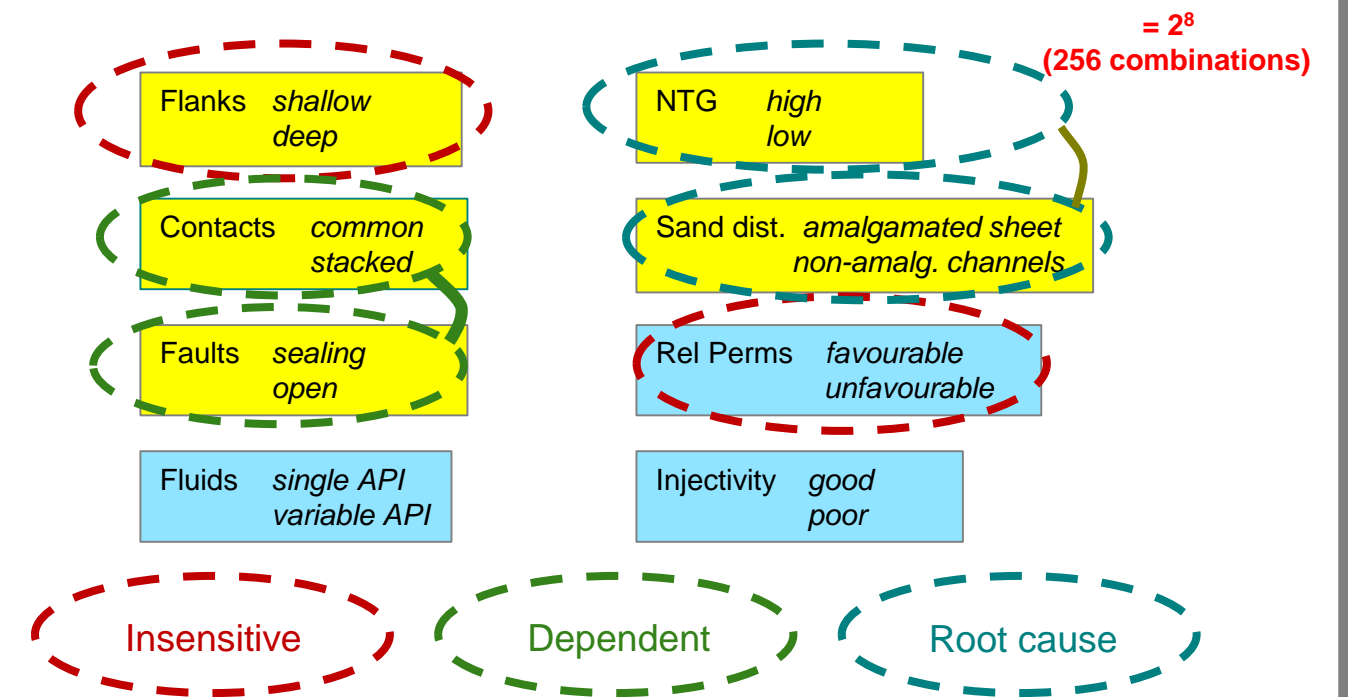

3

Injectivity *good poor*

Example probability tree

The short list of independent uncertainties converted to a probability tree
